Amsonia hubrichtii

Narrow leaf blue star was discovered in 1942 in Arkansas by Leslie Hubricht. While not a Delaware native, its golden fall color blends charmingly with the blues and purples of our native asters. Amsonia is an upright, bushy perennial that thrives in full sun or part shade. The foliage is narrow, lacy and almost threadlike. Clusters of sky blue flowers emerge atop the foliage when it breaks ground in April, and continue blooming into May. The foliage adds a delicate texture to the garden. But, the real reason to grow this Amsonia is for the stunning golden fall foliage. A drift of Amsonia can brighten any fall garden.

Cryptomeria japonica 'Yoshino'

‘Yoshino’ is a handsome cultivar of the Japanese cedar. It has rich bright blue summer foliage that becomes slightly bronze-green in cold weather. ‘Yoshino’ grows fast and develops a graceful, pyramidal form with little to no pruning. While not a native species, it blends well with our natives having a form similar to Eastern red cedar. It does not seem to be bothered by deer and tolerates light shade so it can be used as either a specimen tree or an evergreen screen.
