Swamp White Oak, native to the eastern United States, is a great shade tree for large areas. It grows at a moderate rate ultimately reaching a height of 50-60 feet with an equal or greater spread. This oak’s leaves, which are a dark shiny green above and silvery white below, turn yellow to coppery-red in the fall. Acorns, often found in pairs, are loved by wildlife. Plant *Quercus bicolor* in full sun to part shade. It will tolerate a range of soil types including damp sites and is drought tolerant.
